## Benefits of MITS for PICK/MultiValue Systems

***Discover important trends and information from the untapped gold mine of historical data***

Many companies enter thousands upon thousands of transactions that contain information that may be used to greatly improve many aspects of business operations. MITS transforms this immense amount of information into a powerful and quickly accessed gold mine of information.

**Enhances present systems**

Without the pain and effort of replacing a current operational system, MITS simply adds a great deal of value to systems already in place.

**Reduces load on operational systems during day**

Because of the ease-of-use of MITS, a great deal of information can be quickly accessed; therefore, making many of the traditional burdensome reports that users ran in the past to be unnecessary. This will free up valuable processing power for interactive use during the business day.

**Use all existing terminals and PC's connected to operational systems**

The powerful Mits Query Language (MQL) can either run on existing characters-based terminals or Windows PC's.

**Quick and easy export to Windows files**

Any information presented in a MITS flash screen can be exported to PC files, quickly and easily. Once there, users can perform further processing with Microsoft Excel, Microsoft Word or any other Windows product able to accept a common data format.

**Dramatic reduction in labor and effort needed to get important information**

Typical information research cycle: Print a standard report. Review information and discover that more research needs to be done. Run another report that may help the research and/or seek programming personnel to generate a special report to perform the research. This "cycle" is common in all businesses with moderate to large volumes of data. MITS replaces this "cycle" by giving the operator data mining tools to perform the information research with drill-down capability and with variable column and period information. All this within seconds rather than the hours and possibly days of effort of finding the same information on a traditional system.

**Rapid application development of MITS applications**

The setup effort involved in establishing a MITS application is measured in hours and days versus weeks and months to accomplish the same result with traditional design / programming methods. This greatly reduces the delivery time and cost of development of information reports to your end users.

**Very low training time and effort needed to use MITS**

MITS training usually amounts to a few hours by a certified MITS professional from TRG. The intuitive design of MITS guides the user into its powerful and expansive capabilities. A "right-click" is all that is needed in MITSView to get a user started.

**Flexible and cost effective MITS configurations**

MITS can run entirely on the existing MultiValue operational system or be put on a separate server.
